

1. Search

I think with my model, users should be able to search for recipes by

- name,
- ingredient,
- cooking_time and
- difficulty“.

The output will be a list of clickable recipes, linking to their respective details view.

3. Data Analysis

- No user input
- Pie Chart: difficulty – categories (pie pieces), percentage of total – piece size
- Bar Chart: x-axis: cooking time, y-axis: number of recipes
- Line Chart: x-axis: recipe name, y-axis: number of ingredients

5. Execution flow

- Home
- adds recipe
- uses search to find his new recipe
- looks at details to check all is correct
- logs out
